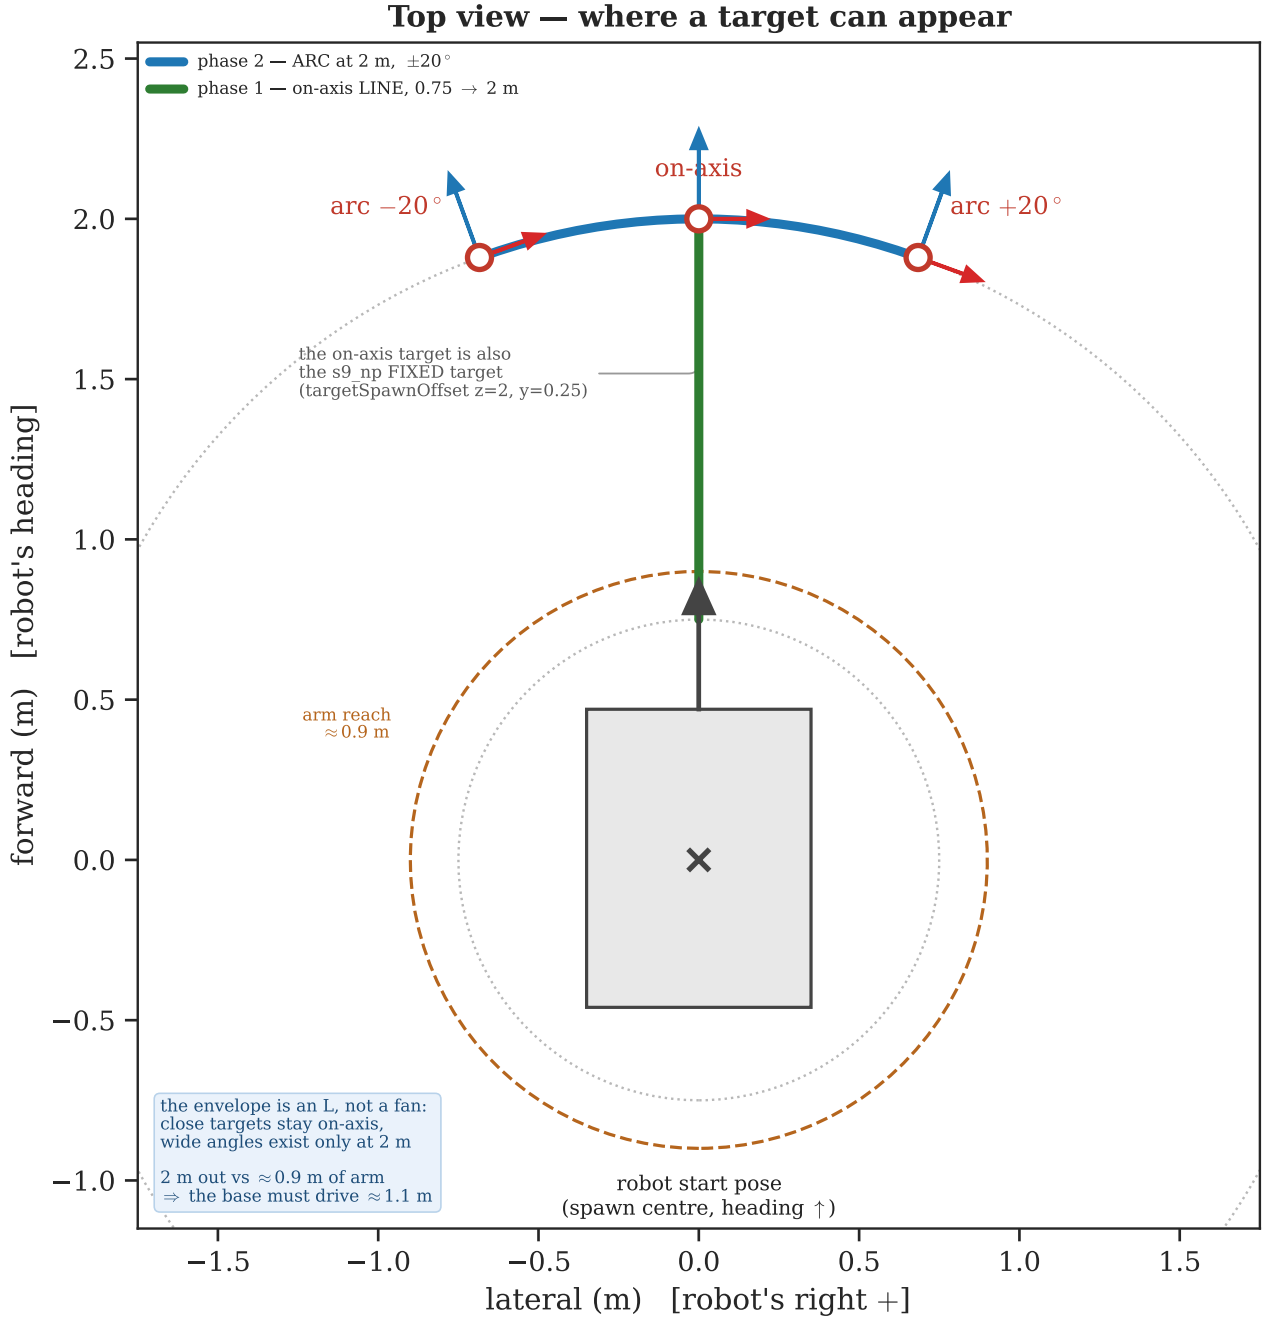
The T-arc target curriculum — the spawn envelope shared by every whole-body model

minRadius 0.75 m, lineRadius 2 m, arcTotalDeg 40 (±20°), height 0.25 m, zAwayFromRobot on



Training ramp (s9_tarc): the radius grows over the first 500,000 Academy steps, then the arc opens over the next 1,000,000. Evaluation uses the deterministic set (count 4 / lineN 1) = the three red targets. Each model's observation origin (base_link) sits at its own offset from the spawn centre, which is why the per-model JSON spawn_dist / spawn_az read differently for the same physical target.
