s9_tarc — deterministic line+arc evaluation (100% reached, mean 8.3 s to the gate)

s9_tarc — line+arc evaluation

checkpoint: ppo_scoutsan_s9_tarc.zip

targets: 5 passes over 3 curriculum targets (2.0 m, ±20°)

reached the eval gate: 100%

mean min d: 13.2 mm mean min φ: 0.39°

mean time to gate: 83 decisions = 8.3 s

gate: $d < 0.02$ m, $\varphi < 1.15°$ (= the scene's successRadius / orientToleranceRad)

the agent ENDS the episode the instant the gate fires (no hold),

so a settle-hold cannot be measured for s9 — unlike the wb regimes.
